

CHAPTER 4

A Tour of the Cell

YOU MUST KNOW

- Three differences between prokaryotic and eukaryotic cells.
- The structure and function of organelles common to plant and animal cells.
- The structure and function of organelles found only in plant cells or only in animal cells.
- How different cell types show differences in subcellular components.
- How internal membranes and organelles contribute to cell functions.
- How cell size and shape affect the overall rate of nutrient intake and waste elimination.

2 TYPES OF CELLS:

1. **Prokaryotes**: Domain Bacteria & Archaea
2. **Eukaryotes** (Domain Eukarya): Protists, Fungi, Plants, Animals

(b) A thin section through the bacterium *Bacillus coagulans* (TEM)

A PROKARYOTIC CELL (BACTERIA)

PROKARYOTE VS. EUKARYOTE

- “before” “kernel”
 - No nucleus
 - DNA in a nucleoid
 - Cytosol
 - No organelles other than ribosomes
 - Small size
 - Primitive
 - i.e. Bacteria & Archaea
- “true” “kernel”
 - Has nucleus and nuclear envelope
 - Cytosol
 - Membrane-bound organelles with specialized structure/function
 - Much larger in size
 - More complex
 - i.e. plant/animal cell

CELL SIZE AND SCALE

<http://learn.genetics.utah.edu/content/begin/cells/scale/>

Scale of the Universe:

http://www.onemorelevel.com/game/scale_of_the_universe_2012

- Cells must be small to maintain a large **surface area to volume ratio**
- Large S.A. allows \uparrow rates of chemical exchange between cell and environment

Surface area increases while total volume remains constant

Total surface area [sum of the surface areas (height \times width) of all box sides \times number of boxes]	6	150	750
Total volume [height \times width \times length \times number of boxes]	1	125	125
Surface-to-volume (S-to-V) ratio [surface area \div volume]	6	1.2	6

CALCULATE VOLUME OF A SPHERE:

$$V = \frac{4}{3}\pi r^3$$

© 2016 Pearson Education, Inc.

SURFACE AREA EXAMPLE (ANIMAL):

Small Intestine: *highly folded surface* to increase absorption of nutrients

- Villi: finger-like projections on SI wall
- Microvilli: projections on each cell

Folds → Villi → Microvilli

SURFACE AREA EXAMPLE (PLANT):

Root hairs: extensions of root epidermal cells; increase surface area for absorbing water and minerals

© 2011 Pearson Education, Inc.

NUCLEUS

- Function: control center of cell
- Contains DNA (& mRNA)
- Surrounded by double membrane (**nuclear envelope**)
 - Continuous with the rough ER
- **Nuclear pores**: control what enters/leaves nucleus
- **Chromatin**: complex of DNA + proteins; makes up chromosomes
- **Nucleolus**: region where ribosomal subunits (rRNA + proteins) are formed

Surface of nuclear envelope (TEM)

Pore complexes (TEM)

RIBOSOMES

- Function: protein synthesis
- Composed of rRNA + protein
- Large subunit + small subunit
- Types:
 1. **Free ribosomes**: float in cytosol, produce proteins used within cell
 2. **Bound ribosomes**: attached to ER, make proteins for export from cell

TEM showing ER and ribosomes

Diagram of a ribosome

ENDOMEMBRANE SYSTEM:

Regulates protein traffic & performs metabolic functions

ENDOPLASMIC RETICULUM (ER)

- Network of membranes and sacs
- Types:
 1. **Rough ER**: ribosomes on surface
 - Function: package proteins for secretion, send transport vesicles to Golgi, make replacement membrane
 2. **Smooth ER**: no ribosomes on surface
 - Function: synthesize lipids, metabolize carbs, detox drugs & poisons, store Ca^{2+}

ENDOPLASMIC RETICULUM (ER)

GOLGI APPARATUS

- Function: synthesis & packaging of materials (small molecules) for transport (in vesicles); produce lysosomes
- Series of flattened membrane sacs (cisternae)
 - **Cis face**: receives vesicles
 - **Trans face**: ships vesicles

LYSOSOMES

- Function: intracellular digestion; recycle cell's materials; programmed cell death (apoptosis)
- Contains **hydrolytic enzymes**

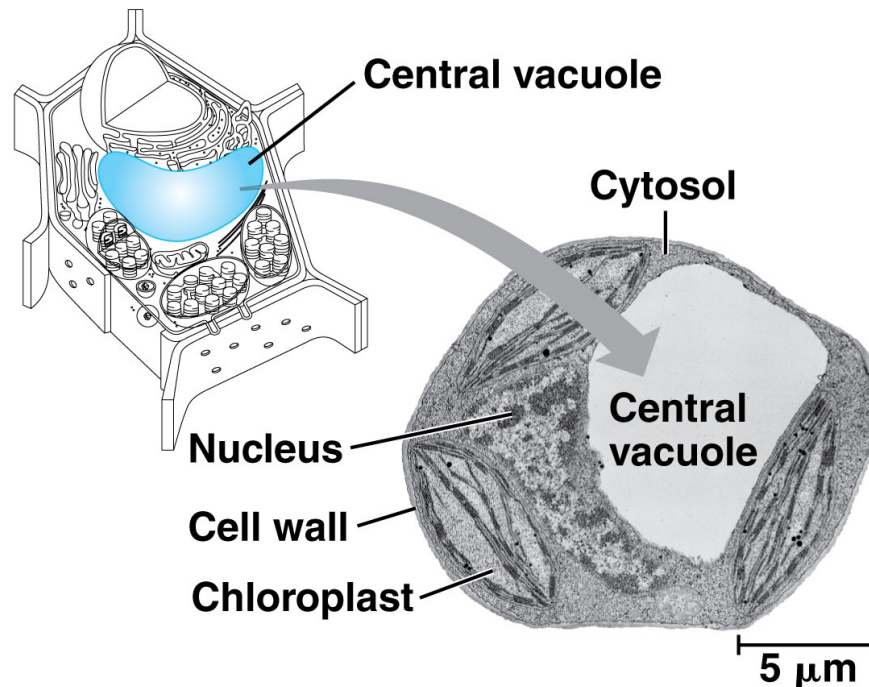

(a) Phagocytosis

(b) Autophagy

VACUOLES

- Function: storage of materials (food, water, minerals, pigments, poisons)
- Membrane-bound vesicles
- Eg. food vacuoles, contractile vacuoles
- **Plants: large central vacuole -- stores water, ions; retains water for turgor pressure**

Nucleus

Rough ER

Smooth ER

**Plasma
membrane**

Not in plant cells:
 Lysosomes
 Centrioles
 Flagella (in some plant sperm)

MITOCHONDRIA

- Function: site of cellular respiration
- Double membrane: **outer** and **inner membrane**
- **Cristae**: folds of inner membrane; contains enzymes for ATP production; increased surface area to ↑ ATP made
- **Matrix**: fluid-filled inner compartment

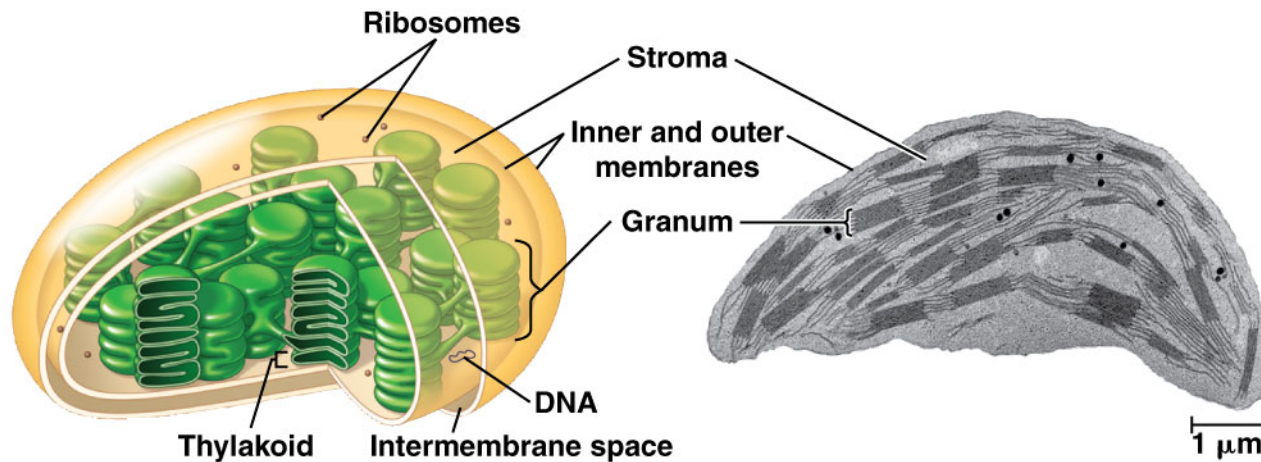

(a) Diagram and TEM of mitochondrion

(b) Network of mitochondria in a protist cell (LM)

CHLOROPLASTS

- Function: site of photosynthesis
- Double membrane
- Thylakoid disks in stacks (grana); stroma (fluid)
- Contains **chlorophylls** (pigments) for capturing sunlight energy

(a) Diagram and TEM of chloroplast

(b) Chloroplasts in an algal cell

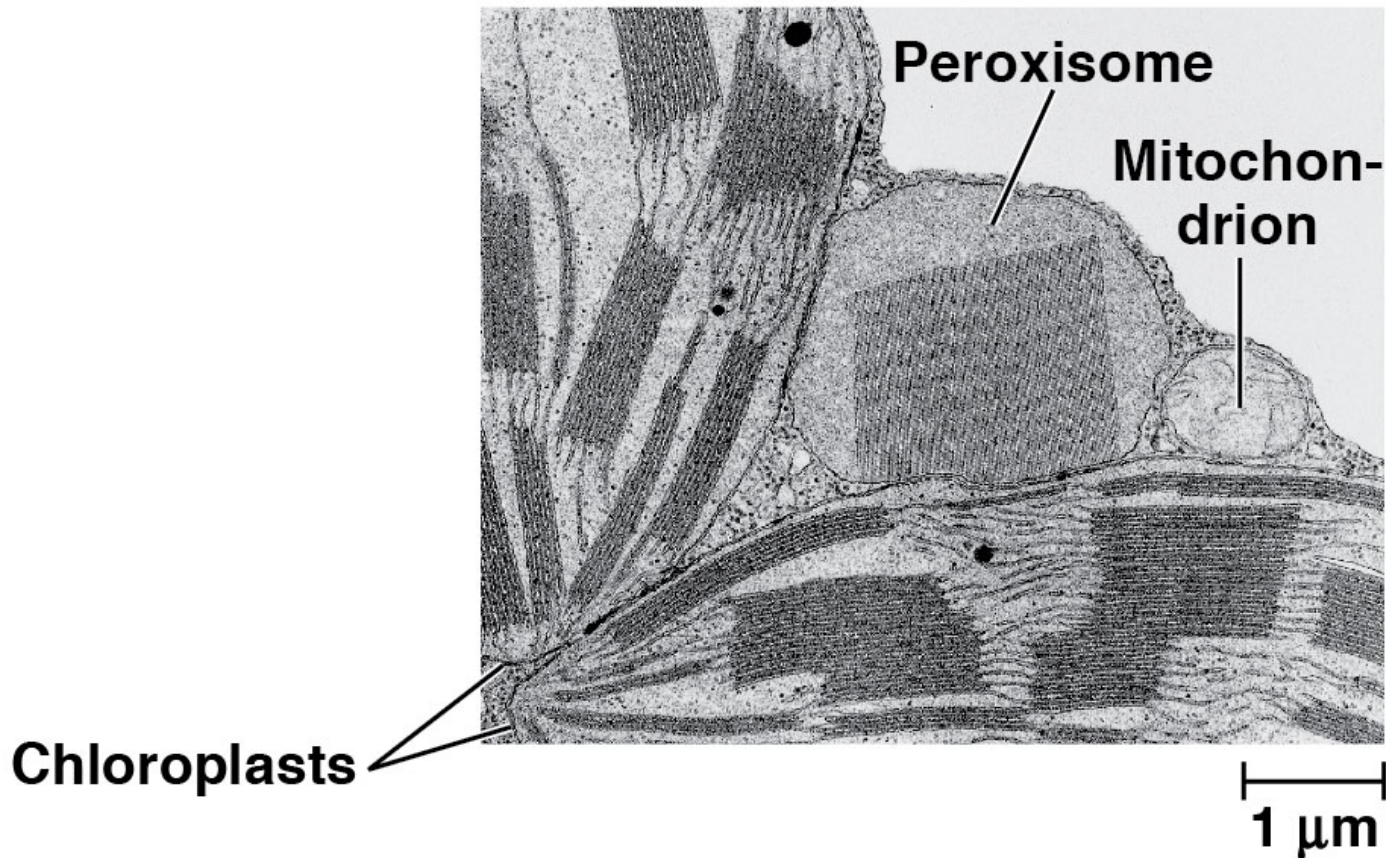

ENDOSYMBIONT THEORY

- Mitochondria & chloroplasts share similar origin
- Prokaryotic cells engulfed by ancestors of eukaryotic cells
- Evidence:
 - Double-membrane structure
 - Have own ribosomes & DNA
 - Reproduce independently within cell

PEROXISOMES

- Functions: break down fatty acids; detox alcohol
- Involves production of hydrogen peroxide (H_2O_2)

CYTOSKELETON: NETWORK OF PROTEIN FIBERS

- Function: support, motility, regulate biochemical activities

Table 4.1 The Structure and Function of the Cytoskeleton

Property	Microtubules (Tubulin Polymers)	Microfilaments (Actin Filaments)	Intermediate Filaments
Structure	Hollow tubes	Two intertwined strands of actin	Fibrous proteins coiled into cables
Diameter	25 nm with 15-nm lumen	7 nm	8–12 nm
Protein subunits	Tubulin, a dimer consisting of α -tubulin and β -tubulin	Actin	One of several different proteins (such as keratins)
Main functions	Maintenance of cell shape; cell motility; chromosome movements in cell division; organelle movements	Maintenance of cell shape; changes in cell shape; muscle contraction; cytoplasmic streaming (plant cells); cell motility; cell division (animal cells)	Maintenance of cell shape; anchorage of nucleus and certain other organelles; formation of nuclear lamina

Fluorescence micrographs of fibroblasts. Fibroblasts are a favorite cell type for cell biology studies because they spread out flat and their internal structures are easy to see. In each, the structure of interest has been tagged with fluorescent molecules. The DNA in the nucleus has also been tagged in the first micrograph (blue) and third micrograph (orange).

PLANT CELLS

- **Cell wall:** protect plant, maintain shape
 - Composed of **cellulose**
- **Plasmodesmata:** channels between cells to allow passage of molecules from cell to cell

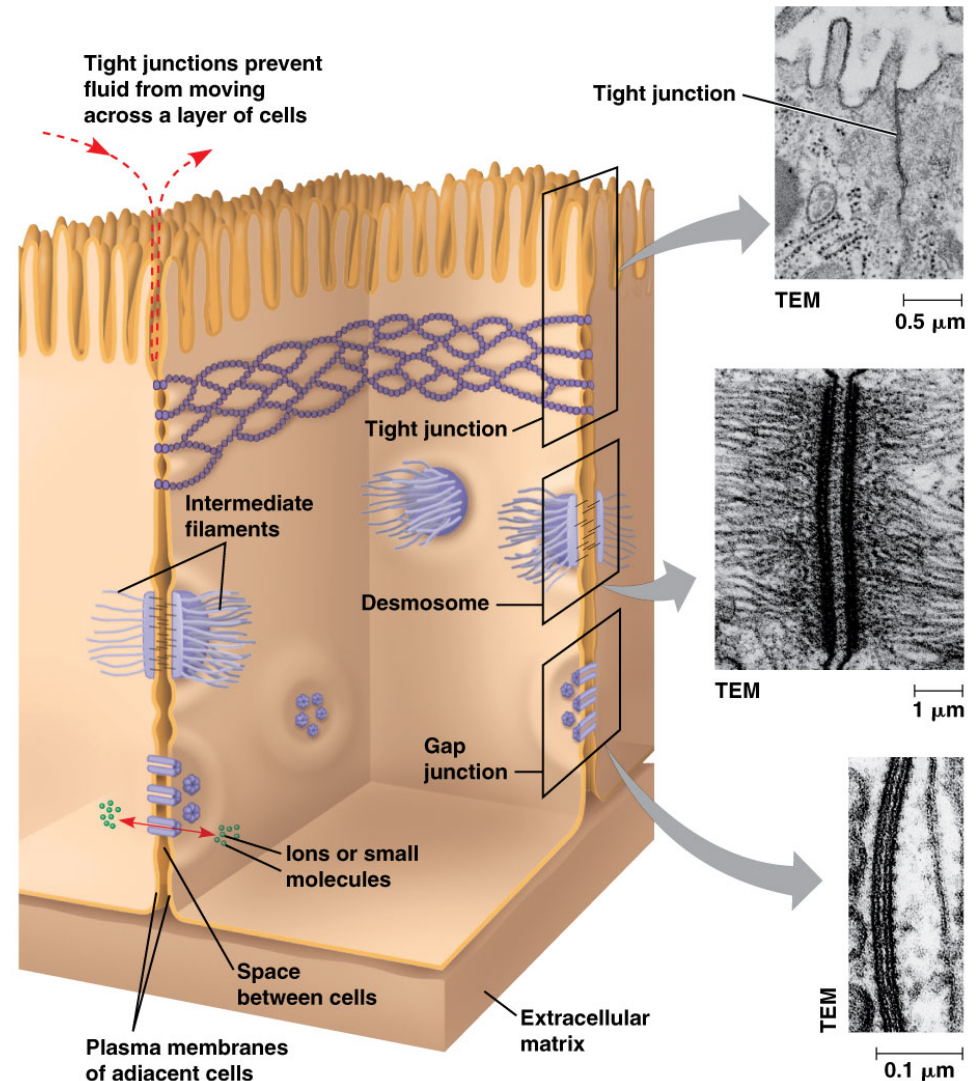

EXTRACELLULAR MATRIX (ECM)

- Outside plasma membrane of **animal cells**
- Composed of glycoproteins (ex. collagen)
- Function: Strengthens tissues and transmits external signals to cell

INTERCELLULAR JUNCTIONS (ANIMAL CELLS)

- **Tight junctions**: 2 cells are fused to form watertight seal
- **Desmosomes**: “rivets” that fasten adjacent cells into strong sheets
- **Gap junctions**: channels through which ions, sugar, small molecules can pass

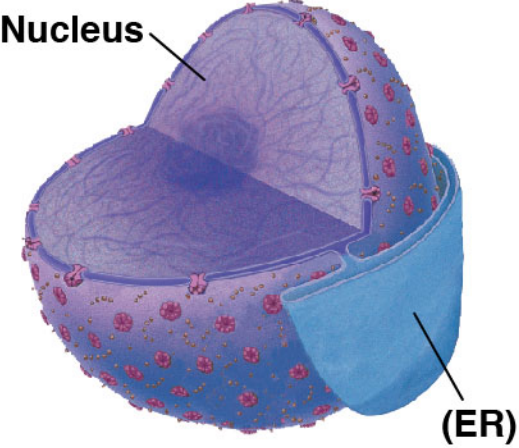

Plant Cells Only	Animals Cells Only
Central vacuoles	Lysosomes
Chloroplasts	Centrioles
Cell wall of cellulose	Flagella, cilia
Plasmodesmata	Desmosomes, tight and gap junctions
	Extracellular matrix (ECM)

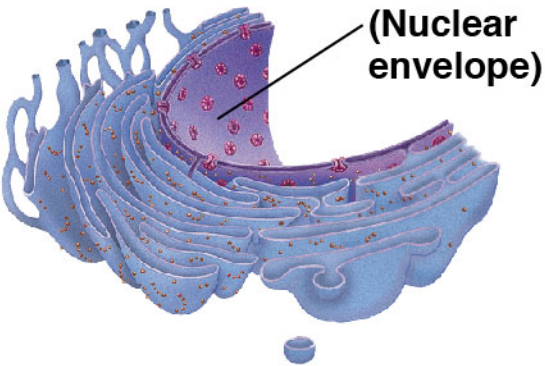

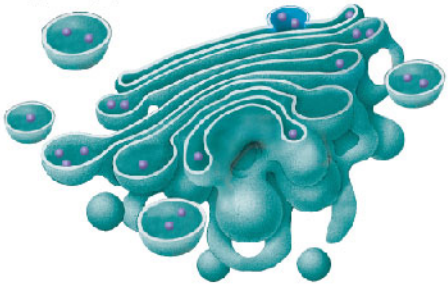

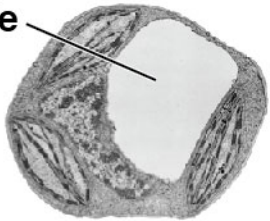

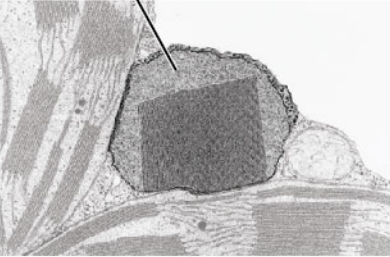

HARVARD CELL VIDEO

[http://multimedia.mcb.harvard.edu/
anim_innerlife.html](http://multimedia.mcb.harvard.edu/anim_innerlife.html)

Cell Component	Structure	Function
 <p>Nucleus</p>	<p>Surrounded by nuclear envelope (double membrane) perforated by nuclear pores; nuclear envelope continuous with endoplasmic reticulum (ER)</p>	<p>Houses chromosomes, which are made of chromatin (DNA and proteins); contains nucleoli, where ribosomal subunits are made; pores regulate entry and exit of materials</p>
 <p>Ribosome</p>	<p>Two subunits made of ribosomal RNA and proteins; can be free in cytosol or bound to ER</p>	<p>Protein synthesis</p>

Cell Component	Structure	Function
<p>Endoplasmic reticulum</p> 	<p>Extensive network of membrane-bounded tubules and sacs; membrane separates lumen from cytosol; continuous with nuclear envelope</p>	<p>Smooth ER: synthesis of lipids, metabolism of carbohydrates, Ca²⁺ storage, detoxification of drugs and poisons</p> <p>Rough ER: aids in synthesis of secretory and other proteins from bound ribosomes; adds carbohydrates to proteins to make glycoproteins; produces new membrane</p>
<p>Golgi apparatus</p> 	<p>Stacks of flattened membranous sacs; has polarity (<i>cis</i> and <i>trans</i> faces)</p>	<p>Modification of proteins, carbohydrates on proteins, and phospholipids; synthesis of many polysaccharides; sorting of Golgi products, which are then released in vesicles</p>
<p>Lysosome</p> 	<p>Membranous sac of hydrolytic enzymes (in animal cells)</p>	<p>Breakdown of ingested substances, cell macromolecules, and damaged organelles for recycling</p>
<p>Vacuole</p> 	<p>Large membrane-bounded vesicle</p>	<p>Digestion, storage, waste disposal, water balance, plant cell growth and protection</p>

Cell Component	Structure	Function
<p>Mitochondrion</p> 	<p>Bounded by double membrane; inner membrane has infoldings (cristae)</p>	<p>Cellular respiration</p>
<p>Chloroplast</p> 	<p>Typically two membranes around fluid stroma, which contains thylakoids stacked into grana (in cells of photosynthetic eukaryotes, including plants)</p>	<p>Photosynthesis</p>
<p>Peroxisome</p> 	<p>Specialized metabolic compartment bounded by a single membrane</p>	<p>Contains enzymes that transfer hydrogen atoms from certain molecules to oxygen, producing hydrogen peroxide (H_2O_2) as a by-product; H_2O_2 is converted to water by another enzyme</p>

Hey ladies,
how about
a date?

Sure thing!

oh man, he
gets all the
girls.

Smooth Endoplasmic Reticulum

might-ochondria

definitely-chondria

I KNEW MITOCHONDRIA
BACK BEFORE THEY
SIGNED WITH EUKARYA.

SELLOUTS.

A meme featuring the character Moss from the TV show 'The Office'. He is wearing his signature glasses and a light blue button-down shirt with a dark tie. He has a serious, slightly skeptical expression. The background is a blurred office setting with another person in a light blue shirt visible in the background.

RIBOSOMES MAKE PROTEINS

FALSE.

**RIBOSOMES MAKE POLYPEPTIDE CHAINS
WHICH ARE THEN FOLDED INTO PROTEINS**

mitochondria

- tumblr famous
- only drinks gatorade
- powerhouse of the cell

nucleus

- control freak
- "everyone is important uwu"
- unofficial squad leader

ribosome

- actually works for a living
- always making things for their friends
- highkey wants to be nucleus's bff

nucleolus

- nucleus's actual bff
- superiority complex
- basically 12 years old

golgi apparatus

- loves duct tape
- gives great advice
- unproblematic fave

lysosome

- always salty
- loves dogs
- will fight anyone

ER

- total mom friend
- better than you at literally everything
- only one who can drive

vacuole

- really quiet except when they're not
- v dependable
- does crossfit

chloroplast

- super elitist
- only wears green except on st patricks day
- lowkey hippie
